/notoe="Organ: small intestine; Vector: pBluescript II
/notoe="Organ: small intestine; Vector: pBluescript II
/S(+); Site_1: EcoRI; Site_2: Not1; This normalized
library was constructed from 1 million independent clones.
cDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to NotI adapters, digested with
EcoRI, size-selected, and cloned into the NotI and EcoRI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1996): 791, except that a significantly longer
reannealing hybridization was used."

//done="Organ: limbs; Vector: pBluescript II KS(+); Site_1:
ECORI, Site_2: Not1; This normalized library was
constructed from limilion independent clones. cDNA
synthesis was initiated using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded
was blunted, ligated to NotI adapters, digested with
ECORI, size-selected, and cloned into the NotI and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

ABC transporter constituent of Brevibacterium lactofermentum, its encoded gene and variants, applicable in breeding Corynebacteria particularly for production of L-glutamic acid.

Claim 5; Page 30-31; 34pp; Japanese.

The present invention describes a protein (I) which can be used to construct an ATP binding cassette (ABC) transporter. ABC transporter DNAs can be used in breeding Corymbbacteria particularly for production of L-glutamic acid. The present sequence represents an ORF (open reading frame) protein from the Brevibacterium lactofermentum gitBD gene, which is used in the exemplification of the present invention. the target sequence, and where the parts of the primers having
consistential complementarity define the termini of the target sequence to
be amplified, assay comprising contacting a test compound with the
contacting and determining whether the test compound binds to the protein
and a Streptococcus pneumoniae bacterium, where one or more genes
concoling the proteins has been rendered inactive. The proteins, nucleic
concoling the proteins has been rendered inactive. The proteins, nucleic
concoling the proteins disease or infection due to streptococcus
controlled, antibody and compositions are useful as medicaments for
treating or preventing a disease or infection due to streptococcus
controlled, particularly S. pneumoniae, such as preumonia, sepsis, oitis
media or ear infection. They are also useful in developing vactines,
diagnostics and antibiotics. The methods are useful for identifying
confimunodominant proteins. The present sequence is one of the 2469 proteins
contact the sequence data for this patent did not form part of the printed
contact price of the printed proteins at ftp. wipo.int/pub/published_pot_sequences. (Updated on 23-OCT-2003 to
standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä,

constitution and are set an antibody which binds one of the proteins. Treating appearing a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nuclectides 8-100 of a sequence not defined in the specification, for amplifying a target composition in the specification, for amplifying a target to sequence not defined in the specification, for amplifying a target companies in the specification, for amplifying a target sequence contained within a Streeptococcus nucleic acid sequence, the first primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having conditions assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus caid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this parent did not form part of the printed expectivitation, but was obtained in electronic format directly from NIPO or at fitp.wipo.int/pub/published_pot_sequences. (Updated on 23-OCT-2003 to standardise OS field)
                       New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or
                                                                                                                                                                                                                                          The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the
                                                                                                                                                                              Claim 1; SEQ ID NO 4138; 56pp; English.

a Streptococcus pneumoniae genomic sequence, a fragment or degenerate variant of the polynuclectide or a nucleic acid sequence 95% identical to one of the polynuclectides. The S. pneumoniae polynuclectides and encoded polypeptides (ABPB1299-ABPB1674) are useful for treating or preventing S pneumoniae infections or non-systemic diseases, e.g. ottiss media, which are induced or exacerbated by S. pneumoniae. These are also useful for detecting S. pneumoniae in a biological sample or diagnosing S. pneumoniae in a subject. The polynuclectides have antibacterial activity and are useful in gene therapy EDVDLLKLSTRKQRLYRKNTVGYLFQDYALIPDRTVKFNLQLAVEKHKWPEIPQVLHAVG 120 121 -LESFE-----EKPVFELSGGEQORTALARVLLKNPRIILADEPTGALDLTNSELVIEA 173 1 MIEINDLKKSFGVRILWQGLSHKFLPGTMTALTGASGSGKSTLLNCLGTLDKPSSGQILV 60 The invention relates to isolated polynucleotides (ABZ72147-ABZ42522) 10; Gaps New Streptococcus pneumoniae polynucleotides, useful for treating or preventing S. pneumoniae infections, or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. ```
The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable formath, or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the specification (available on a computer readable formath, or its fragment, corpressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS5654. Also included are an antibody which binds one of the proteins, Creating a patient by administering the protein. DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid eaduence of the first primer is substantially complementary to the target sequence, and where the specification, for amplifying a target the target sequence, and where the parts of the primers having substantially complementary to the target sequence or and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementary of the primers having contacting a streptococcus pneumoniae bacterium, where one or more genes encoding the protein and determining whether the test compound with the protein, and determining and contacting a test compound with the conding the proteins has been rendered inactive. The proteins, neclain or preventing a disease or infection due to streptococcus conding the proteins and antibiotics. The methods are useful for identifying the media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying expense of immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed of the sequence is one of the printed of the protein of the printed of the protein of the printed of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 FGQTNLAVNSAKSQTIIREHISYLFQNFALIDDETVEYNLMLALKYVKLPKKDKLKKVEE 120

This sequence represents a Streptococcus pneumoniae transport protein. The invention provides DNA sequences (AAV65201 to AAV6534) from the Streptococcus pneumoniae genome and corresponding protein sequences (AAW80728). The protein sequences are classified as hypothetical, cell wall biosynthetic, external target, or minimal gene ext proteins. A recombinant host containing a vector comprising any of the above nucleic acids can be used for the recombinant expression of the proteins. The invention also provides a DNA chip having arrayed on it at last 15 hase pair fragment of any one or more of these DNA sequences. The DNA chip can be used methods for evaluating gene expression in S. pneumoniae and for identifying virulence genes in S. pneumoniae. The although the selective of the provention or peptide fragments can be used to treat S. pneumoniae infection. The antibodies can also be used to detect S. pneumoniae cells
                    Streptococcus pneumoniae protein; recombinant; gene expression; DNA chip; virulence; antibody; infection; detection; treatment; hypothetical; cell wall biosynthetic, external target; minimal gene set protein.

```
The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as Streptococcus pneumoniae type 4 strain genomic sequence appearing as treating a patient by administering the protein, binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the complete acid edefined in the specification, for amplifying a target sequence ontained within a Streptococcus nucleic acid sequence, the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the target sequence of the target sequence, and where the parts of the primer shaving substantially complementary to the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes cond molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus
New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or

The nucleic acid sequence is useful in the detection and/or amplification of mucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention bips research in lactic bacteria, particularly useful in the production of yogurt and
variant of the polynucleotide or a nucleic acid sequence 95% identical to one of the polynucleotides. The S. pneumoniae polynucleotides and encoded polypeptides (ABP81299-ABP81674) are useful for treating or preventing S. pneumoniae infections or non-systemic diseases, e.g. otitis media, which are induced or exacerbated by S. pneumoniae. These are also useful for pneumoniae in a biological sample or disgnosing S. pneumoniae in a biological sample or disgnosing S. pneumoniae in a biological sample or disgnosing S. activity and are useful in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        60 RGKD---LANYKSSDFFRHELGYLFQNFGLIENQSIEENLKLGLIGGKLSRSEQRLRQKQ 116

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
```

```
New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                             114
                                                                                                                                                                                                                                                                174
                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense, prokaryotic essential gene, cell proliferation, drug design.

orquences Arobson's taplescine recipies Linear certum actual and organizations and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPPO syndrowits, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lessons associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by this patent did not form part of the printed specification, but was

Claim 3k; SEQ ID NO 6896; 1481pp; English.

Claim 3k; SEQ ID NO 6896; 1481pp; English.

The invention relates to an isolated polymucleotide (ACR64435-ACR64733) encoding the polypeptides encoding acne vulgaris, or for stimulating an immune acnes protein.

Claim 3k; SEQ ID NO 6896; 1481pp; English.

The invention relates to an isolated polymucleotide (ACR64435-ACR64733) encoding the polypeptides encoded by the polymucleotides (BMB36624-ABW64356) and to immunogenic fragments of P. acnes polypeptides. The invention as an isolated or calls comprising a polypeptide of the invention; an immune response specific for a P. acnes polypeptide of the invention; an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising P. acnes polypeptides, antibodies, fusion proteins. T cell populations, or antibodies, antibodies, fusion proteins compositing P. acnes in a method for stimulating cells that express the polypeptide); a method and an isolated presence or absence of P. acnes in a patient, mad a method for inhibiting the presence or absence of P. acnes in a patient, mad and an active conversion or polymerial patient; and a method for inhibiting the presence or absence of P. acnes in a patient, mad and an accompaniant or polymerial patient and an encoded patient and an active profession or proteins or polymerial patient and an encoded patient and an encoded patient and an encoded patient and an encoded patient and an encoded patient and an encoded patient anot be accompaniant and an encoded patient and an encoded patient

The invention relates to an isolated polymuclectide (ACF64435-ACF64733)
encoding a Propionibacterium acnes protein. The invention also relates to
polypeptides encoded by the polymuclectides (ARM35524-ARM64556) and to
immunogenic fragments of P. acnes polypeptides. The invention
additionally encompasses expression vectors and host cells comprising a
continuously encompasses expression vectors and host cells comprising a
compression proteins comprising a polypeptide of the invention, a
method for stimulating an immune response specific for a P. acnes
compression isolated T cell population comprising P acnes polypeptides,
distributed and an isolated T cell population comprising P. acnes polypeptides,
distributed and an isolated and an isolated T cell populations, or
polypeptide and an isolated spression (comprising P. acnes polypeptides,
distributed and an expression proteins, T cell populations, or
polymuclectides, antibodies, fusion proteins, T cell populations, or
conferentian and amethod for inhibiting the development of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
patient; or for stimulations or antigen-presenting cells that express the
polymucleotides are useful for diagnosing, preventing or treating acne
vulgaris, or for stimulating an immune response specific for a P. acnes
confunction of an immune response against P. acnes, or for treating acne,
and the kit is useful for performing a diagnostic assay The present
confunction of an immune response against P. acnes, or for treating acne,
and the kit is useful for performing a diagnostic assay The present
conford by an ORP (open reading frame) contained within the P.
canes polymucleotides of the invention. Note: The sequence data for this
petent did not form part of the printed specification, but was obtained
in electronic format directly from WIPO at
cons polymucleotides.

The invention relates to an isolated nucleic acid derived from Enterococcus faecium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 acquential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a crecombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 364 disclosed sequences encoding 364 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E. faecium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans nucleic acid is useful for recombinant production of Candida albicans and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ς,

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that inhibits a biological pathway the gene product or that has an activity against a biological pathway to proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for redlular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent

to which each of the strains is present in a culture or collection of brains, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational for dury discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the sproteins have antibacterial and antiinflammatory activity. (I), mucleic acids encoding (I), ABN6604-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by C Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to composition comprising (I) or a nucleic acid encoding (I), may be composition comprising (I) or a nucleic acid encoding (I), may be cused as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be cused in gene therapp. Abribodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
detecting a compound that binds to the protein

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                      US-09-868-338-9

Patent No. 6342385

GENERAL INFORMATION:
TITLE OF INVENTION: MUTACIN I BIOSYNTHESIS GENES AND PROTEINS
PILE REPERENCE: UAB-17402/22

CURRENT APPLICATION WUMBER: US/09/627,376

CURRENT FILING DATE: 2001-05-30

NUMBER OF SEQ ID NOS: 17

SOFTWARE: Patentin version 3.0

SEQ ID NO 15

LENGTH: 246

TYPE: PRT

ORGANISM: Streptococcus mutans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match 31.6%; Score 322.5; DB 4; Length 246; Best Local Similarity 35.8%; Pred. TITLE OF INVENTION: WICKLET ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
TITLE OF INVENTION: BEIDERNIDIS PRO DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/134,001C
CURRENT PILING DATE: 1998-08-13
PRIOR PELING DATE: 1997-08-14
PRIOR PILING DATE: 1997-08-14
PRIOR FILING DATE: 1997-08-14
NUMBER OF SEQ ID NOS: 5674
SEQ ID NO 3832
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 6667, Application US/09107532A
Patent No. 6583275
